

## Modification to the 120mph Speedo to make the Cruise control work

Just an FYI if you do ever want your cruise control to work again, you just need to swap the 130mph speed sensor on the back of the speedo to the 85mph sensor.

I finally fixed mine last year so my voice warning system would work again:

If you still have the 85mph speedo, you'll see how the speed sensor is attached. Just remove the one from the 130mph and install the 85mph one.

The speed sensor is needed for some of the voice warnings: door open, e-brake on, and also controls the MAF burn cycle for my Z31T ecu / MAF setup.
